future

The intelligent approach to conserving energy

Schaerer Coffee Art models now incorporate energy conservation techniques as a standard feature.

The PowerSave mode saves energy in an intelligent manner. Consumption is incrementally reduced during periods of non-use, resulting in energy savings of up to 34% while in PowerSave mode.

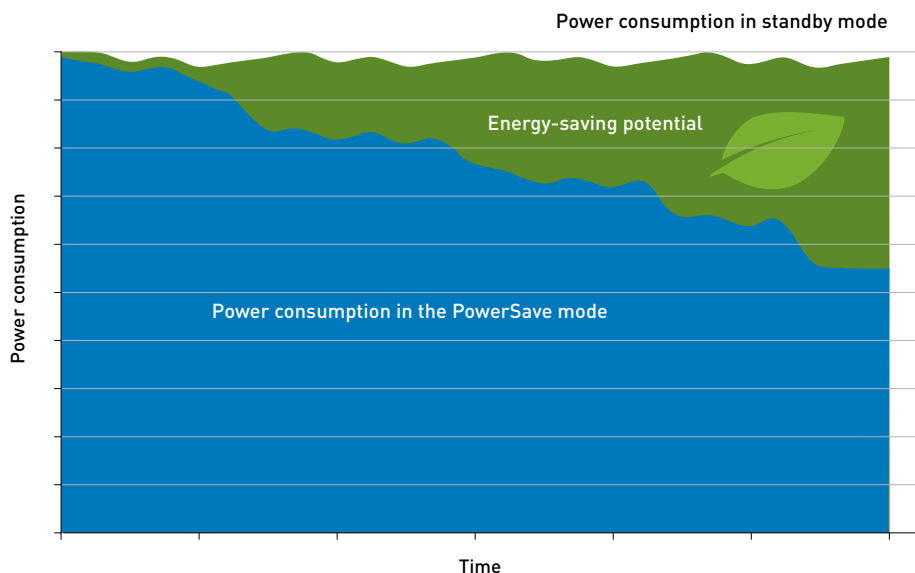

The energy-saving regulation of the boiler operating temperature guarantees quick dispensing of beverages at all times, and regulates the coffee, tea and steam boilers independently of one another. The PowerSave mode is available beginning with software version 5.1.

Energy-saving through programmable switching on and off.

The proven automatic switch on or switch off of the coffee machine is more energy efficient than the standby mode, which continues to consume power. The coffee machine is promptly ready for use and may also be switched off automatically if desired; for example, after cleaning.

When used together, the PowerSave mode and the automatic switching on and off significantly reduce power consumption.

Comparison of the electric power consumption of a Schaerer Coffee Art Plus in the Standby mode versus the PowerSave mode
